

Cryomodulation for the Reduction of Inflammation in Patients with Acne

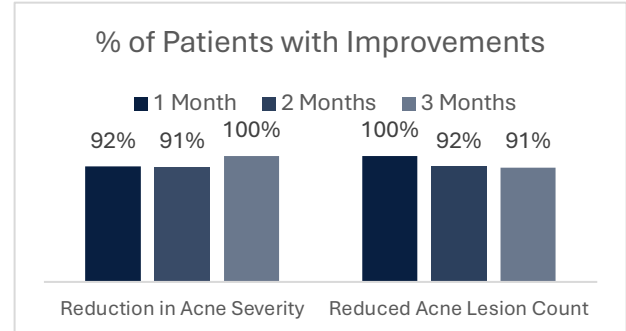

A prospective clinical study to evaluate the Glacial® Rx System in patients with acne enrolled 14 subjects who received a series of five Glacial Glide **Rx** treatments at 2-week intervals.¹

RESULTS

- >90% of patients had reduction in acne severity and acne lesion count at 1, 2, and 3 months after treatment
- >90% of patients rated by investigator as having global cosmetic improvement at 1, 2, and 3 months
- 100% of subjects rated themselves as cosmetically improved at 3 months
- 100% of patients rated the procedure as comfortable
- >90% of patients responded they would have the procedure again and would recommend it to others
- Patients reported fewer breakouts, reduced hyperpigmentation and acne scarring, reduced redness, and improved skin brightness and clarity
- No treatment side effects, no device-related adverse events

CONCLUSIONS

Study data support the use of cryomodulation® to suppress inflammation in patients with acne, to reduce symptoms and improve skin appearance. Reductions in acne severity were achieved in a simple, comfortable procedure with high patient comfort and patient satisfaction
